

# swissforms solutions

## *Being able to do anything, but not having to do anything!*

Do you want professional PDF forms? With intelligent calculations, validations and completeness check? And the ability to save all of this? Would you also like to be able to enter the input data in your applications quickly without errors and without having to type it in manually? Even from forms that have been printed out? Then you have found the right tool with swissforms.

And the best thing is, with swissforms you can start small. You only buy the functions you need. Maybe you start by making intelligent PDF forms with calculations and validations. In just a few days, you will thus have your first clever forms online, inexpensively and without risk. However you can also take the fast track with swissforms. swissforms keeps up with your requirements.

## **Process form data in real time**

Do you really want to have to type in the information from a form? Certainly not. Forms created with swissforms can send you the entries in encoded form. These are then forwarded to the intended applications or personnel. Thus you can immediately comply with customer requests instead of requiring several days like the competition. Do you want to bet that this will have an effect on your sales?

## **2D DataMatrix bar code**

"Yes, but our forms require signatures." Sure. And as long as digital signatures are not standard procedure, forms will continue to be printed out. Of course with swissforms you have the solution for this too. During the printing process, the PDF form generates a 2D DataMatrix bar code and prints this out as well. You can scan this 2D DataMatrix bar code with a handheld scanner and forward it to applications or personnel.

## **Create forms effortlessly**

You probably think this type of forms can only be created by clever specialists. You're right about that. Without swissforms, this requires expensive programmers with excellent knowledge of PDF. But with swissforms, "normal" PC users can do it just as well, but faster. All fields and functions are ready for use in no time at all. The user positions these objects on the forms using the mouse. Many clever assistants help position and align the fields precisely. Calculations and business logic are entered extremely easily using commands similar to those used in spreadsheet applications. Done.

## **Yes, but we also need...**

Do you have special processes? Individual integrations? As a swissforms customer, we will not leave you out in the cold. We will find pragmatic solutions with you, which you can implement for special requirements.

For example, would you like to process and forward forms in several steps and in different locations? Or connect "Adobe LiveCycle Reader® Extensions" to swissforms to release forms for digital signature? Or...

## *Just be able to do anything, but not have to do anything!*

Take the liberty. With swissforms you can do practically anything that can be done with forms. But you don't have to! And most importantly, you don't have to buy anything that you don't need. You don't even have to create forms yourself if you don't want to. We will do it for you!

For a very reasonable price.
